PREPARED FOR: J POORNA CHANDAR

Task 79: Unique Paths

PROBLEM DESCRIPTION

There is a robot on an m x n grid. The robot is initially located at the top-left corner. The robot tries to move to the bottom-right corner. The robot can only move either down or right at any point in time. Given the two integers m and n, return the number of possible unique paths that the robot can take to reach the bottom-right corner.

JAVA SOLUTION

```
class Solution {
    public int uniquePaths(int m, int n) {
        int[] dp = new int[n];
        java.util.Arrays.fill(dp, 1);

        for (int i = 1; i < m; i++) {
            for (int j = 1; j < n; j++) {
                dp[j] += dp[j - 1];
            }
        }

        return dp[n - 1];
    }
}
```
